

## **World Energy Focus**

### **“Every Single Drop Of Oil”..... has gone through QC.**

Fuels such as gasoline, premium gasoline, gasohol, jet fuel, diesel, and bunker oil are hydro carbon derived from crude oil and have gone through the refining processes to separate light and heavy elements; to get rid of unwanted particles such as sulfur; and to control and improve product quality.

Quality control is very important because oil could easily lose its quality if there is poor production, transportation, and storage. Therefore, PTT Public Company Limited (PTT) considers the top priority in step-by-step quality control. PTT starts from its procurement in which supplies have to come from advanced refinery whose products must have gone through quality analysis either in the vessel, truck, or at the pipeline transmission end prior to be received by the refinery. And throughout the refining processes and storage, quality control has been made by PTT Quality Control Laboratory to ensure highest product quality prior to release the products to customers.

In addition, PTT also has the Mobile Laboratory Units for quality testing of oil at PTT Service Stations located nationwide to ensure that “every single drop of PTT fuels has gone through thorough inspection processes”.

**PTT Quality Control Laboratory is located at PTT’s Prakanong Office. PTT Lab meets international laboratory standards and equipped with advanced tools and equipments. PTT’s lab expertises are also full of experiences. Testing results will always be compared with other local and international laboratories’ such as the British-based Air BP, the US-based ASTM, and the Dutch-based iis. PTT Lab is certified by the ISO/IEC 17025 (former ISO/IEC Guide 25) on oil fuels, LPG, and lubricating products testing as well as on temperature testing. Therefore, consumer trust toward premium quality can be found in PTT products.**
